ABSTRACT:

CHG DATE=19990617 STATUS=O> In a device for investigating liquid properties by determining the propagation velocity of sound, a measuring cell is provided which has a sound path accommodating the preparation. This sound path is arranged between an electroacoustic transducer and an acoustoelectric

transducer. In order to be able to determine the liquid properties simply and accurately in the case of small samples, the transducers are connected to an excitation and detecting circuit which is connected to an electronic control unit.
